

COVER LETTER

Dear Hiring Team,

I am writing to apply for the Working Student (Data Engineer_448290) – Data Engineer position in Walldorf. I am a 2nd-semester (April 2026) M.Sc. SAP Engineering & Analytics student at Hochschule Fresenius Heidelberg, living in Walldorf/Heidelberg and fully available from April 2026. With 1.5+ years prior experience at SAP Walldorf and currently practicing building ETL pipelines, working with heterogeneous data formats and designing data models on SAP BTP, I am genuinely excited to contribute to the Business Knowledge Graphs team.

My Master's program is run in close cooperation with SAP and prepares students specifically for SAP technical roles, with modules covering SAP BTP & Integration, S/4HANA ABAP/CA, SAP UI5/Fiori and SAP Analytics Cloud. Through sessions with SAP BTP leadership (for example with Erik Bartmann and colleagues), I consistently align my work with real SAP engineering scenarios — including data pipeline design and semantic data modeling.

The role description maps directly to what **I have already been building:**

ETL pipelines and data ingestion: I built an automated Python/pandas ETL pipeline that ingests messy retail sales CSV data, performs type checks, handles missing values, removes duplicates, recalculates KPIs with logging, and produces analysis-ready outputs — reducing manual preparation time by ~80%. I also wrote automated test datasets to verify transformation outputs against expected results, ensuring ETL continuity.

Heterogeneous data formats — JSON, XML, CDS, OData EDMX, BPMN: In my S/4HANA ABAP/CA training, I worked directly with Core Data Services (CDS) and AMDP — both listed as key data formats your team handles. Through my CAP (Node.js) OData V4 service on SAP BTP, I designed and consumed OData endpoints including their EDMX metadata documents and worked extensively with JSON/XML API responses. For my RISE-style analytics project, I documented the Order-to-Cash process in BPMN-style notation using SAP Signavio.

Data models and transformation logic: In SAP HANA Cloud, I designed table structures (SALES1000: 14 columns, INVENTORY: 6 columns) and built four Calculation Views encoding explicit transformation logic: CVSALESOVERVIEW (base KPIs, profit margin, lead time), CVSALESVSINVENTORY (JOIN with stock coverage calculations), CVCHANNELPRODUCTANALYSIS, and CVPROFITTREND (time-series YoY analysis).

REST and OData API integration: My CAP Node.js service exposes data from HANA Cloud as OData V4 endpoints consumed by SAP Analytics Cloud via a live connection — covering the full ingestion-to-visualization pipeline using SQL, REST and OData.

Cloud applications and supplementary services: My RISE project runs on SAP BTP (hana-free tier) with SAP Business Application Studio and VS Code, and I understand cloud service architecture including API routing, OData wrappers and BTP environment configuration.

I am also deeply interested in Knowledge Graphs and semantic technologies. Through my working paper on SAP Data Intelligence — covering metadata cataloging, semantic layer construction and pipeline orchestration — and my awareness of SAP Datasphere's semantic modeling capabilities, I understand how structured, well-modeled data becomes the foundation for AI reliability (reducing hallucination, ensuring compliance). I am eager to go deeper into JSON-LD, RDF and SPARQL in a hands-on team context.

My previous roles at SAP Services Sales MEE, Non-Commercial Licensing and the Transformation Advisory Center (IX Studio, walldorf) ***trained me to work in agile, international teams, track tasks in Jira, and communicate*** clearly across technical and ***business stakeholders***.

I am based in Heidelberg and would welcome on-site collaboration with your team. Thank you for considering my application — I would be glad to walk you through my Python pipeline and HANA Cloud modeling work in a technical interview.

Kind regards,

Varun Raval
