

COVER LETTER

Dear Hiring Manager,

I am currently moving towards my second semester of my specialized Master's program in *"SAP Engineering & Analytics"*, which is offered by a close *alliance with SAP and Hochschule Fresenius, Heidelberg*, in a SAP-aligned curriculum that prepares students for data-driven roles in the SAP ecosystem. This focus, combined with my practical projects in analytics and automation, makes the SAP CS&D iXp Intern – CEA MEE – Data Science and AI Automation role in Walldorf motivates me to apply for this job with the hope of applying my skills to real customer engagements and insight-driven decision making

In my recent academic work, I have produced two research papers that are highly relevant to this position. First paper examines SAP Fiori 2.0 and SAPUI5 : Enhancing Enterprise User Experience and *how well-designed user interfaces improve user productivity and adoption of SAP solutions*. Second paper analyzes *migration from SAP ECC to SAP S/4HANA from a business perspective, analysing case studies* to explore value realization, risk mitigation, and change management—topics that strongly connect to Customer Engagement Advisory's mission to drive successful cloud adoption and help customers become intelligent enterprises. In my first semester, "User Research Methodology" course provided me a chance to visit SAP Walldorf and Frankfurt to attend events (nov '25 and jan '26) around SAP's AI assistant and Joule integration and under the guidance of SAP UX Team we conduct user research interviews and observed user behaviour with the help of provided SAP assets. These activities trained me to understand customer pain points, structure qualitative insights, and translate them into actionable requirements, which matches the role's importance on supporting customer engagements, preparing materials, and documenting findings for stakeholders.

In addition to my academic background, I bring prior professional experience as a former SAP employee, where I worked in sales licensing and marketing teams. This role familiarized me with SAP's internal tools, systems, workflows, and culture, providing insight into how SAP positions its solutions and collaborates with customers. Combined with my current SAP-focused studies, this provides me with a holistic view of both the technical and business aspects of SAP's portfolio and customer engagements.

From a technical standpoint, I have hands-on experience with SQL, Python for data analysis and pipeline development, as well as SAP-centric analytics using SAP HANA, SAP Business Application Studio and SAP Analytics Cloud. From my projects, in my "Sales Analytics Dashboard" project in SAP Analytics Cloud, I built a 4 pages of story on top of global sales data with regional, product, and online/offline channels drill-downs and a forecasting view for revenue and profit, enabling data-driven commercial decisions. In my other project, "Retail Sales Data Cleaning Automation Pipeline", I developed a Python script that automatically cleans, validates, and summarizes messy sales datasets, including handling missing values, recalculating KPIs, and generating a cleaned

output ready for analysis. These projects reflect the responsibilities in this internship, including assisting in collecting and analyzing large datasets, supporting the development of business intelligence dashboards and reports, and performing exploratory data analysis to identify trends and patterns. I am also planning an end-to-end RISE-style retail analytics project that uses SAP Signavio, SAP Data Intelligence, SAP HANA, and SAP Analytics Cloud to model the order-to-cash process and visualize KPIs, which further strengthens my alignment with SAP's cloud and data strategy.

I enjoy working in international, cross-functional teams and am used to presenting results through clear documentation and structured presentations. My time at SAP and my current studies in Germany have strengthened my professional communication skills and my ability to collaborate with people from diverse backgrounds. I currently live in Heidelberg and am fully willing and able to work regularly from the Walldorf office, whether in a full-time internship or as a working student up to 20 hours per week. Now I will transition to my 2nd semester (April 2026) and will be available till September 2027.

I am highly motivated to contribute to the Customer Engagement Advisory team, support customer-facing colleagues with data-driven insights, and further develop my skills in data science and AI automation within the SAP ecosystem. I would be pleased to discuss how my SAP-designed academic background, prior SAP experience, and current analytics projects can support your team's objectives.

Thank you very much for considering my application. I look forward to the possibility of contributing to SAP as part of the iXp program.

Best regards,
Varun Raval
